Tasks:

Please use CDK to implement the required resources in the first CloudFormation assignment.

Save your work

Create a new GitHub repository and commit your project to this repository. You could create a new Git repository on your working machine and then commit the project files to it, and then push the local repository up to GitHub.

Terminate application environment

Make sure you clean up the created resources to minimize your AWS bill.

Submitting your assignment

Please submit your GitHub URL on Canvas. Make sure that repository is public or include me as another owner of that repository. I will review your published work on GitHub after the homework due date.
